The average values are calculated from all the readings recorded during each hour-long period. For example, the value shown in the 7 column is the average of all the readings recorded between 07:00 and 07:59

Where there are multiple sensors monitoring a particular room, the average values are calculated from all the readings recorded by all the sensors.

A value shown in blue indicates that the average value was below the low limit.

A value shown in red indicates that the average value was above the high limit.

A value shown in orange indicates that the average value was outside the acceptable limits therefore triggering an alarm, but the alarm has not yet been acknowledged.

A value shown in grey indicates that the average value was for a time that is outside of the room's alarm schedule i.e. when an alarm would not have been triggered even if the average value was outside the acceptable limits.

Any blank cells represent missing data (i.e sensor did not communicate)
